Business Insights Report – Sales & Transaction Dashboard

1. **Objective**: - The purpose of this dashboard is to analyse transactional sales data across multiple store locations, product categories, and time periods. The goal is to identify key revenue drivers, customer purchasing patterns, and operational opportunities to improve business performance.

2. Key Findings

a. Revenue Performance

- Total revenue generated: **~698,812**
- Total transactions: **149,116**
- Average transaction value: **~4.69**

Insights - This indicates a **high-volume, low-ticket-size business model**, suggesting reliance on repeat customers rather than high-value purchases.

b. Product Category Insights

- **Coffee** is the top-performing category in terms of total revenue.
- Other categories contribute less significantly, indicating a strong dependency on a single product segment.

Insights: - The business is heavily cantered around coffee products, which creates both a strength (brand focus) and a risk (lack of diversification).

c. Location Performance

- The highest revenue-generating store location is **Hell's Kitchen**.

Insights: - This location likely benefits from higher footfall, better demographics, or stronger operational execution. It can serve as a benchmark for other locations.

d. Time-Based Trends

- Peak transaction hours are concentrated during **midday and evening periods**.
- Certain days of the week show higher activity, indicating predictable customer behavior patterns.

Insights: - Customer demand is time-sensitive, which opens opportunities for targeted promotions and staffing optimization.

3. Business Problems Identified

1. **Overdependence on a Single Product Category**
    - Majority of revenue comes from coffee.
    - Risk of revenue instability if demand shifts.
2. **Low Average Transaction Value**
    - Customers are purchasing low-cost items with minimal bundling.
3. **Uneven Store Performance**
    - Some locations significantly outperform others.
4. **Underutilized Time Periods**
    - Off-peak hours show lower engagement and revenue.

4. Recommendations & Solutions

a. Product Strategy

- Introduce **cross-selling and bundling** (e.g., coffee + bakery items).
- Promote underperforming categories through discounts or combos.

b. Revenue Optimization

- Implement **upselling strategies** at checkout.
- Introduce **loyalty programs** to increase repeat purchase value.

c. Location Benchmarking

- Analyze what drives success at top-performing locations.
- Replicate strategies (pricing, layout, staffing) across other stores.

d. Time-Based Marketing

- Offer **happy hour discounts** during low-traffic periods.
- Align staff scheduling with peak demand hours to improve efficiency.

5. <u>Conclusion</u>: - The dashboard reveals a business with strong transactional volume but opportunities for growth in **average revenue per customer, product diversification, and operational consistency across locations**. By leveraging data-driven strategies, the business can enhance profitability while maintaining its strong customer base.

6. Skills Demonstrated
